

TV Antenna/Cable Amplifier

Added a 'Winegard SensarPro' signal amplifier and channel sensor with an electronic Antenna/Cable switch.

This unit allows us to switch between the campground cable system (when available) and the over-the-air antenna signal without a switch 3 db loss. Plus allowing the input signal gain to be amplified between 1 and 20 db.

Also allows the user to individually select a preferred channel, then the user can adjust the antenna direction for the highest signal gain.

This switch below the unit is used to disconnect power when not in use, to minimize battery drain.
